Alma Mater Studiorum - Università di Bologna

`valeria.simoncini@unibo.it`

Some matrix equations

- Sylvester matrix equation

$$A\mathbf{X} + \mathbf{X}B + D = 0$$

Eigenvalue pbs and tracking, Control, MOR, Assignment pbs, Riccati eqn

Some matrix equations

- Sylvester matrix equation

$$A\mathbf{X} + \mathbf{X}B + D = 0$$

Eigenvalue pbs and tracking, Control, MOR, Assignment pbs, Riccati eqn

- Lyapunov matrix equation

$$A\mathbf{X} + \mathbf{X}A^{\top} + D = 0, \quad D = D^{\top}$$

Stability analysis in Control and Dynamical systems, Signal processing, eigenvalue computations

Some matrix equations

- Sylvester matrix equation

$$A\mathbf{X} + \mathbf{X}B + D = 0$$

Eigenvalue pbs and tracking, Control, MOR, Assignment pbs, Riccati eqn

- Lyapunov matrix equation

$$A\mathbf{X} + \mathbf{X}A^{\top} + D = 0, \quad D = D^{\top}$$

Stability analysis in Control and Dynamical systems, Signal processing, eigenvalue computations

- Multiterm matrix equation

$$A_1\mathbf{X}B_1 + A_2\mathbf{X}B_2 + \dots + A_\ell\mathbf{X}B_\ell = C$$

Control, (Stochastic) PDEs, ...

Survey article: [V.Simoncini, SIAM Review 2016.](#)

More matrix equations

- Systems of linear matrix equations:

$$A_2 \mathbf{X} + \mathbf{X} A_1 + B^T \mathbf{P} = F_1$$

$$A_1 \mathbf{Y} + \mathbf{Y} A_2 + \mathbf{P} B = F_2$$

$$B \mathbf{X} + \mathbf{Y} B^T = F_3$$

More matrix equations

- Systems of linear matrix equations:

$$A_2 \mathbf{X} + \mathbf{X} A_1 + B^T \mathbf{P} = F_1$$

$$A_1 \mathbf{Y} + \mathbf{Y} A_2 + \mathbf{P} B = F_2$$

$$B \mathbf{X} + \mathbf{Y} B^T = F_3$$

- Riccati equation: Find $\mathbf{X} \in \mathbb{R}^{n \times n}$ such that

$$A \mathbf{X} + \mathbf{X} A^T - \mathbf{X} B B^T \mathbf{X} + C^T C = 0$$

workhorse in Control Theory

More matrix equations

- Systems of linear matrix equations:

$$A_2 \mathbf{X} + \mathbf{X} A_1 + B^T \mathbf{P} = F_1$$

$$A_1 \mathbf{Y} + \mathbf{Y} A_2 + \mathbf{P} B = F_2$$

$$B \mathbf{X} + \mathbf{Y} B^T = F_3$$

- Riccati equation: Find $\mathbf{X} \in \mathbb{R}^{n \times n}$ such that

$$A \mathbf{X} + \mathbf{X} A^T - \mathbf{X} B B^T \mathbf{X} + C^T C = 0$$

workhorse in Control Theory

Focus: All or some of the matrices are large (and possibly sparse)

Solving the Lyapunov equation. The problem

Approximate \mathbf{X} in:

$$A\mathbf{X} + \mathbf{X}A^{\top} + BB^{\top} = 0$$

$$A \in \mathbb{R}^{n \times n} \text{ neg.real} \quad B \in \mathbb{R}^{n \times p}, \quad 1 \leq p \ll n$$

Solving the Lyapunov equation. The problem

Approximate \mathbf{X} in:

$$A\mathbf{X} + \mathbf{X}A^\top + BB^\top = 0$$

$$A \in \mathbb{R}^{n \times n} \text{ neg.real} \quad B \in \mathbb{R}^{n \times p}, \quad 1 \leq p \ll n$$

Time-invariant linear system:

$$\mathbf{x}'(t) = A\mathbf{x}(t) + B\mathbf{u}(t), \quad \mathbf{x}(0) = x_0$$

Closed form solution:

$$\mathbf{X} = \int_0^\infty e^{-tA} BB^\top e^{-tA^\top} dt$$

\Rightarrow \mathbf{X} symmetric semidef.

see, e.g., Antoulas '05, Benner '06

Linear systems vs linear matrix equations

Large linear systems:

$$Ax = b, \quad A \in \mathbb{R}^{n \times n}$$

- Krylov subspace methods (CG, MINRES, GMRES, BiCGSTAB, etc.)
- Preconditioners: find P such that

$$AP^{-1}\tilde{x} = b \quad x = P^{-1}\tilde{x}$$

is **easier** and **fast** to solve

Linear systems vs linear matrix equations

Large linear systems:

$$Ax = b, \quad A \in \mathbb{R}^{n \times n}$$

- Krylov subspace methods (CG, MINRES, GMRES, BiCGSTAB, etc.)
- Preconditioners: find P such that

$$AP^{-1}\tilde{x} = b \quad x = P^{-1}\tilde{x}$$

is **easier** and **fast** to solve

Large linear matrix equations:

$$AX + XA^T + BB^T = 0$$

- No preconditioning - to preserve symmetry
- X is a large, dense matrix \Rightarrow low rank approximation

$$X \approx \tilde{X} = ZZ^T, \quad Z \text{ tall}$$

Linear systems vs linear matrix equations

Large linear systems:

$$Ax = b, \quad A \in \mathbb{R}^{n \times n}$$

- Krylov subspace methods (CG, MINRES, GMRES, BiCGSTAB, etc.)
- Preconditioners: find P such that

$$AP^{-1}\tilde{x} = b \quad x = P^{-1}\tilde{x}$$

is **easier** and **fast** to solve

Large linear matrix equations:

$$AX + XA^\top + BB^\top = 0$$

Kronecker formulation:

$$(A \otimes I + I \otimes A)x = b \quad x = \text{vec}(\mathbf{X})$$

Projection-type methods

Given a low dimensional approximation space \mathcal{K} ,

$$\mathbf{X} \approx X_m \quad \text{col}(X_m) \in \mathcal{K}$$

Galerkin condition: $R := AX_m + X_m A^\top + BB^\top \perp \mathcal{K}$

$$V_m^\top R V_m = 0 \quad \mathcal{K} = \text{Range}(V_m)$$

Projection-type methods

Given a low dimensional approximation space \mathcal{K} ,

$$\mathbf{X} \approx X_m \quad \text{col}(X_m) \in \mathcal{K}$$

Galerkin condition: $R := AX_m + X_m A^\top + BB^\top \perp \mathcal{K}$

$$V_m^\top R V_m = 0 \quad \mathcal{K} = \text{Range}(V_m)$$

Assume $V_m^\top V_m = I_m$ and let $X_m := V_m Y_m V_m^\top$.

Projected Lyapunov equation:

$$V_m^\top (A V_m Y_m V_m^\top + V_m Y_m V_m^\top A^\top + BB^\top) V_m = 0$$

Projection-type methods

Given a low dimensional approximation space \mathcal{K} ,

$$\mathbf{X} \approx X_m \quad \text{col}(X_m) \in \mathcal{K}$$

Galerkin condition: $R := AX_m + X_m A^\top + BB^\top \perp \mathcal{K}$

$$V_m^\top R V_m = 0 \quad \mathcal{K} = \text{Range}(V_m)$$

Assume $V_m^\top V_m = I_m$ and let $X_m := V_m Y_m V_m^\top$.

Projected Lyapunov equation:

$$\begin{aligned} V_m^\top (AV_m Y_m V_m^\top + V_m Y_m V_m^\top A^\top + BB^\top) V_m &= 0 \\ (V_m^\top AV_m) Y_m + Y_m (V_m^\top A^\top V_m) + V_m^\top BB^\top V_m &= 0 \end{aligned}$$

Projection-type methods

Given a low dimensional approximation space \mathcal{K} ,

$$\mathbf{X} \approx X_m \quad \text{col}(X_m) \in \mathcal{K}$$

Galerkin condition: $R := AX_m + X_m A^\top + BB^\top \perp \mathcal{K}$

$$V_m^\top R V_m = 0 \quad \mathcal{K} = \text{Range}(V_m)$$

Assume $V_m^\top V_m = I_m$ and let $X_m := V_m Y_m V_m^\top$.

Projected Lyapunov equation:

$$\begin{aligned} V_m^\top (AV_m Y_m V_m^\top + V_m Y_m V_m^\top A^\top + BB^\top) V_m &= 0 \\ (V_m^\top AV_m) Y_m + Y_m (V_m^\top A^\top V_m) + V_m^\top BB^\top V_m &= 0 \end{aligned}$$

Early contributions: Saad '90, Jaimoukha & Kasenally '94, for

$$\mathcal{K} = \mathcal{K}_m(A, B) = \text{Range}([B, AB, \dots, A^{m-1}B])$$

More recent options as approximation space

Enrich space to decrease space dimension

- Extended Krylov subspace

$$\mathcal{K} = \mathbb{E}\mathcal{K} := \mathcal{K}_m(A, B) + \mathcal{K}_m(A^{-1}, A^{-1}B),$$

that is, $\mathcal{K} = \text{Range}([B, A^{-1}B, AB, A^{-2}B, A^2B, A^{-3}B, \dots,])$

(Druskin & Knizhnerman '98, Simoncini '07)

More recent options as approximation space

Enrich space to decrease space dimension

- Extended Krylov subspace

$$\mathcal{K} = \mathbb{E}\mathbb{K} := \mathcal{K}_m(A, B) + \mathcal{K}_m(A^{-1}, A^{-1}B),$$

that is, $\mathcal{K} = \text{Range}([B, A^{-1}B, AB, A^{-2}B, A^2B, A^{-3}B, \dots,])$

(Druskin & Knizhnerman '98, Simoncini '07)

- Rational Krylov subspace

$$\mathcal{K} = \mathbb{K} := \text{Range}([B, (A - s_1I)^{-1}B, \dots, (A - s_mI)^{-1}B])$$

usually, $\{s_1, \dots, s_m\} \subset \mathbb{C}^+$ chosen either a-priori or dynamically

More recent options as approximation space

Enrich space to decrease space dimension

- Extended Krylov subspace

$$\mathcal{K} = \mathbb{E}\mathbb{K} := \mathcal{K}_m(A, B) + \mathcal{K}_m(A^{-1}, A^{-1}B),$$

that is, $\mathcal{K} = \text{Range}([B, A^{-1}B, AB, A^{-2}B, A^2B, A^{-3}B, \dots,])$

(Druskin & Knizhnerman '98, Simoncini '07)

- Rational Krylov subspace

$$\mathcal{K} = \mathbb{K} := \text{Range}([B, (A - s_1 I)^{-1}B, \dots, (A - s_m I)^{-1}B])$$

usually, $\{s_1, \dots, s_m\} \subset \mathbb{C}^+$ chosen either a-priori or dynamically

In both cases, for $\text{Range}(V_m) = \mathcal{K}$, **projected Lyapunov equation:**

$$(V_m^\top A V_m) Y_m + Y_m (V_m^\top A^\top V_m) + V_m^\top B B^\top V_m = 0$$

$$X_m = V_m Y_m V_m^\top$$

Bilinear systems of matrix equations

Find $\mathbf{X} \in \mathbb{R}^{n_1 \times n_2}$ and $\mathbf{P} \in \mathbb{R}^{m \times n_2}$ such that

$$\begin{aligned} A_1 \mathbf{X} + \mathbf{X} A_2 + B^T \mathbf{P} &= F_1 \\ B \mathbf{X} &= F_2 \end{aligned}$$

with $A_i \in \mathbb{R}^{n_i \times n_i}$, $B \in \mathbb{R}^{m \times n_1}$, $F_1 \in \mathbb{R}^{n_1 \times n_2}$, $F_2 \in \mathbb{R}^{m \times n_2}$, $m \leq n_1$

Emerging matrix formulation of different application problems

- Constraint control
- Mixed formulations of stochastic diffusion problems
- Discretized deterministic/stochastic (Navier-)Stokes equations
- ...

An example. Mixed FE formulation of stochastic Galerkin diffusion pb

$$\begin{aligned}c^{-1}\vec{u} - \nabla p &= 0, \\ -\nabla \cdot \vec{u} &= f,\end{aligned}$$

Assume that $c^{-1} = c_0 + \sum_{r=1}^{\ell} \sqrt{\lambda_r} c_r(\vec{x}) \xi_r(\omega)$ and that an appropriate class of finite elements is used for the discretization of the problem (see, e.g., the derivation in Elman & Furnival & Powell, 2010)

After discretization the problem reads:

$$\begin{bmatrix} G_0 \otimes K_0 + \sum_{r=1}^{\ell} \sqrt{\lambda_r} G_r \otimes K_r & G_0^T \otimes B_0^T \\ G_0 \otimes B_0 & \end{bmatrix} \begin{bmatrix} u \\ p \end{bmatrix} = \begin{bmatrix} 0 \\ f \end{bmatrix}$$

An example. Mixed FE formulation of stochastic Galerkin diffusion pb

$$\begin{aligned} c^{-1}\vec{u} - \nabla p &= 0, \\ -\nabla \cdot \vec{u} &= f, \end{aligned}$$

Assume that $c^{-1} = c_0 + \sum_{r=1}^{\ell} \sqrt{\lambda_r} c_r(\vec{x}) \xi_r(\omega)$ and that an appropriate class of finite elements is used for the discretization of the problem (see, e.g., the derivation in Elman & Furnival & Powell, 2010)

After discretization the problem reads:

$$\begin{bmatrix} G_0 \otimes K_0 + \sum_{r=1}^{\ell} \sqrt{\lambda_r} G_r \otimes K_r & G_0^T \otimes B_0^T \\ G_0 \otimes B_0 & \end{bmatrix} \begin{bmatrix} u \\ p \end{bmatrix} = \begin{bmatrix} 0 \\ f \end{bmatrix}$$

For $\ell = 1$ we obtain

$$\begin{aligned} K_0 \mathbf{X} G_0 + K_1 \mathbf{X} G_1 + B_0^T \mathbf{P} G_0 &= 0, \\ B_0 \mathbf{X} G_0 &= F \end{aligned}$$

The bilinear case. Computational strategies

$$\begin{aligned} A_1 \mathbf{X} + \mathbf{X} A_2 + B^T \mathbf{P} &= F_1 \\ B \mathbf{X} &= F_2 \end{aligned}$$

Kronecker formulation (monolithic):

$$\begin{bmatrix} \mathcal{A} & \mathcal{B}^T \\ \mathcal{B} & \mathcal{O} \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{p} \end{bmatrix} = \begin{bmatrix} f_1 \\ f_2 \end{bmatrix}, \quad \mathcal{A} = I \otimes A_1 + A_2^T \otimes I, \quad \mathcal{B} = B \otimes I$$

with $\mathbf{x} = \text{vec}(\mathbf{X})$, $\mathbf{p} = \text{vec}(\mathbf{P})$, $f_1 = \text{vec}(F_1)$ and $f_2 = \text{vec}(F_2)$

Extremely rich literature from saddle point algebraic linear systems

Trouble: Coefficient matrix has size $(n_1 n_2 + m n_2) \times (n_1 n_2 + m n_2)$

The bilinear case. Computational strategies. Cont'd

$$\begin{aligned} A_1 \mathbf{X} + \mathbf{X} A_2 + B^T \mathbf{P} &= F_1 \\ B \mathbf{X} &= F_2 \end{aligned}$$

★ Derive numerical strategies that directly work with the matrix equations:

- Small scale: Null space method
- Small and medium scale: Schur complement method
(also directly applicable to trilinear case)
- Large scale: Iterative method for low rank $F_i, i = 1, 2$

“Small and medium scale” actually means “Large scale” for the Kronecker form!

Large scale problem. Iterative method. 1/3

$$\begin{aligned} A_1 \mathbf{X} + \mathbf{X} A_2 + B^T \mathbf{P} &= F_1 \\ B \mathbf{X} &= F_2 \end{aligned}$$

Rewrite as

$$\begin{bmatrix} A_1 & B^T \\ B & 0 \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{P} \end{bmatrix} + \begin{bmatrix} I_{n_1} & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{P} \end{bmatrix} A_2 = \begin{bmatrix} F_1 \\ F_2 \end{bmatrix}, \quad \Leftrightarrow \quad \mathcal{M} \mathbf{Z} + \mathcal{D}_0 \mathbf{Z} A_2 = F$$

with

$$\mathcal{M}, \mathcal{D}_0 \in \mathbb{R}^{(n_1+m) \times (n_1+m)}$$

$$A_2 \in \mathbb{R}^{n_2 \times n_2} \text{ nonsingular}$$

\mathcal{D}_0 highly singular

If F low rank, exploit projection-type strategies for Sylvester equations

Large scale problem. Iterative method. 2/3

$$\begin{bmatrix} A_1 & B^T \\ B & 0 \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{P} \end{bmatrix} + \begin{bmatrix} I_{n_1} & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{X} \\ \mathbf{P} \end{bmatrix} A_2 = \begin{bmatrix} F_1 \\ F_2 \end{bmatrix} \quad \Leftrightarrow \quad \mathcal{M}\mathbf{Z} + \mathcal{D}_0\mathbf{Z}A_2 = F$$

with F low rank. We rewrite the matrix equation as a Sylvester equation:

$$\mathbf{Z}A_2^{-1} + \mathcal{M}^{-1}\mathcal{D}_0\mathbf{Z} = \hat{F}$$

with $\hat{F} = \mathcal{M}^{-1}FA_2^{-1}$ of low rank if F is of low rank, $\hat{F} = \hat{F}_\ell \hat{F}_r^T$

$$\Rightarrow \quad \mathbf{Z} \approx \tilde{\mathbf{Z}}_k = V_k \mathbf{Z}_k W_k^T$$

with $\text{Range}(V_k), \text{Range}(W_k)$ appropriate approximation spaces of small dimensions

Large scale problem. Iterative method. 3/3

Galerkin-Projection method

$$\mathbf{Z}A_2^{-1} + \mathcal{M}^{-1}\mathcal{D}_0\mathbf{Z} = \widehat{F}_l\widehat{F}_r^T \quad \Rightarrow \quad \mathbf{Z} \approx \widetilde{\mathbf{Z}}_k = V_k\mathcal{Z}_k W_k^T$$

Choice of V_k, W_k . A possible strategy:

- $W_k = \mathbb{E}\mathbb{K}_k(A_2^{-T}, \widehat{F}_r)$, Extended Krylov subspace
- $V_k = K_k(\mathcal{M}^{-1}\mathcal{D}_0, \widehat{F}_l) \cup K_k((\mathcal{M}^{-1}\mathcal{D}_0 + \sigma I)^{-1}, \widehat{F}_l)$
Augmented Krylov subspace, $\sigma \in \mathbb{R}$
(see, e.g., Shank & Simoncini, 2013)

Note: \mathcal{M} has size $(n_1 + m) \times (n_1 + m)$

(Compare with $(n_1n_2 + mn_2) \times (n_1n_2 + mn_2)$ of the Kronecker form)

Numerical experiments

$$A_1 \mathbf{X} - \mathbf{X} A_2 + B^T \mathbf{P} = 0, \quad \text{vs} \quad \mathcal{A} \mathbf{z} = f$$

$$B \mathbf{X} = F_2$$

$$A_1 \rightarrow \mathcal{L}_1 = -u_{xx} - u_{yy}, \quad F_2 \text{ rank-1}$$

$$A_2 \rightarrow \mathcal{L}_2 = -(e^{-10xy} u_x)_x - (e^{10xy} u_y)_y + 10(x+y)u_x$$

$$B = \text{bidiag}(-1, \underline{1}) \in \mathbb{R}^{(n_2 - n_1) \times n_2}, \quad \text{params: tol} = 10^{-6}, \sigma = 10^{-2}$$

Multiterm linear matrix equation

$$A_1 \mathbf{X} B_1 + A_2 \mathbf{X} B_2 + \dots + A_\ell \mathbf{X} B_\ell = C$$

Applications:

- Control
- (Stochastic) PDEs
- Matrix least squares
- ...

Multiterm linear matrix equation

$$A_1 \mathbf{X} B_1 + A_2 \mathbf{X} B_2 + \dots + A_\ell \mathbf{X} B_\ell = C$$

Applications:

- Control
- (Stochastic) PDEs
- Matrix least squares
- ...

Main device: Kronecker formulation

$$(B_1^\top \otimes A_1 + \dots + B_\ell^\top \otimes A_\ell) x = c$$

Iterative methods: matrix-matrix multiplications and rank truncation

(Benner, Breiten, Bouhamidi, Chehab, Damm, Grasedyck, Jbilou, Kressner, Matthies, Onwunta, Raydan, Stoll, Tobler, Zander, and many others...)

Multiterm linear matrix equation

$$A_1\mathbf{X}B_1 + A_2\mathbf{X}B_2 + \dots + A_\ell\mathbf{X}B_\ell = C$$

Applications:

- Control
- (Stochastic) PDEs
- Matrix least squares
- ...

Alternative approaches:

- Projection onto rich approximation space
- Compression to two-term matrix equation
- Splitting strategy towards two-term matrix equation
- ...

PDEs on uniform grids and separable coeffs

$$-\varepsilon \Delta u + \phi_1(x)\psi_1(y)u_x + \phi_2(x)\psi_2(y)u_y + \gamma_1(x)\gamma_2(y)u = f \quad (x, y) \in \Omega$$

$\phi_i, \psi_i, \gamma_i, i = 1, 2$ sufficiently regular functions + b.c.

Problem discretization by means of a tensor basis

Multiterm linear equation:

$$-\varepsilon T_1 \mathbf{U} - \varepsilon \mathbf{U} T_2 + \Phi_1 B_1 \mathbf{U} \Psi_1 + \Phi_2 \mathbf{U} B_2^\top \Psi_2 + \Gamma_1 \mathbf{U} \Gamma_2 = F$$

Finite Diff.: $\mathbf{U}_{i,j} = \mathbf{U}(x_i, y_j)$ approximate solution at the nodes

PDEs with random inputs

Stochastic steady-state diffusion eqn: *Find* $u : D \times \Omega \rightarrow \mathbb{R}$ *s.t.* \mathbb{P} -*a.s.*,

$$\begin{cases} -\nabla \cdot (a(\mathbf{x}, \omega) \nabla u(\mathbf{x}, \omega)) = f(\mathbf{x}) & \text{in } D \\ u(\mathbf{x}, \omega) = 0 & \text{on } \partial D \end{cases}$$

f : deterministic;

a : random field, linear function of finite no. of real-valued random variables $\xi_r : \Omega \rightarrow \Gamma_r \subset \mathbb{R}$

Use truncated Karhunen–Loève (KL) expansion,

$$a(\mathbf{x}, \omega) = \mu(\mathbf{x}) + \sigma \sum_{r=1}^m \sqrt{\lambda_r} \phi_r(\mathbf{x}) \xi_r(\omega),$$

$\mu(\mathbf{x})$: expected value of diffusion coef.

σ : std dev.

Discretization by stochastic Galerkin

Approx with space in tensor product form^a $\mathcal{X}_h \times S_p$

$$\mathbf{A}\mathbf{x} = \mathbf{b}, \quad \mathbf{A} = G_0 \otimes K_0 + \sum_{r=1}^m G_r \otimes K_r, \quad \mathbf{b} = \mathbf{g}_0 \otimes \mathbf{f}_0,$$

\mathbf{x} : expansion coef. of approx to u in the tensor product basis $\{\varphi_i \psi_k\}$

$K_r \in \mathbb{R}^{n_x \times n_x}$, FE matrices (sym)

$G_r \in \mathbb{R}^{n_\xi \times n_\xi}$, $r = 0, 1, \dots, m$ Galerkin matrices associated w/ S_p (sym.)

\mathbf{g}_0 : first column of G_0

\mathbf{f}_0 : FE rhs of deterministic PDE

$$n_\xi = \dim(S_p) = \frac{(m+p)!}{m!p!} \Rightarrow \boxed{n_x \cdot n_\xi} \text{ huge}$$

^a S_p set of multivariate polyn of total degree $\leq p$

The matrix equation formulation

$$(G_0 \otimes K_0 + G_1 \otimes K_1 + \dots + G_m \otimes K_m) \mathbf{x} = \mathbf{g}_0 \otimes \mathbf{f}_0$$

transforms into

$$K_0 \mathbf{X} G_0 + K_1 \mathbf{X} G_1 + \dots + K_m \mathbf{X} G_m = F, \quad F = \mathbf{f}_0 \mathbf{g}_0^\top$$

$$(G_0 = I)$$

Solution strategy. Conjecture:

- $\{K_r\}$ from trunc'd Karhunen–Loève (KL) expansion

⇓

$$\mathbf{X} \approx \tilde{X} \text{ low rank, } \tilde{X} = X_1 X_2^T$$

(Possibly extending results of Grasedyck, 2004)

Matrix Galerkin approximation of the deterministic part. 1

Approximation space \mathcal{K}_k and basis matrix V_k : $\mathbf{X} \approx X_k = V_k Y$

$$V_k^\top R_k = 0, \quad R_k := K_0 X_k + K_1 X_k G_1 + \dots + K_m X_k G_m - \mathbf{f}_0 \mathbf{g}_0^\top$$

Computational challenges:

- Generation of \mathcal{K}_k involved $m + 1$ different matrices $\{K_r\}$!
- Matrices K_r have different spectral properties
- n_x, n_ξ so large that X_k, R_k should not be formed !

(Powell & Silvester & Simoncini, SISC 2017)

Not discussed but in this category

- Sylvester-like linear matrix equations

$$AX + f(X)B = C$$

typically (but not only!): $f(X) = \bar{X}$, $f(X) = X^\top$, or $f(X) = X^*$
(Bevis, Braden, Byers, Chiang, De Terán, Dopico, Duan, Feng, Gonzalez, Guillery, Hall, Hartwig, Ikramov, Kressner, Montealegre, Reyes, Schröder, Vorntsov, Watkins, Wu, ...)

- Linear systems with complex tensor structure

$$\mathcal{A}\mathbf{x} = b \quad \text{with} \quad \mathcal{A} = \sum_{j=1}^k I_{n_1} \otimes \cdots \otimes I_{n_{j-1}} \otimes A_j \otimes I_{n_{j+1}} \cdots \otimes I_{n_k}.$$

Dolgov, Grasedyck, Khoromskij, Kressner, Oseledets, Tobler, Tyrtysnikov, and many more...

Conclusions

Large-scale (Multiterm) linear equations are a new computational tool

- Great advances in solving really large linear matrix equations
- Second order (matrix) challenges rely on strength and maturity of linear system solvers
- Low-rank tensor formats is the new generation of approximations
