

## **The Agmon-Douglis-Nirenberg Problem for Dynamic Boundary Conditions**

By  
Jerry Goldstein  
University of Memphis

Of concern are certain reaction-diffusion systems with total mass bounded in the  $L^1$  norm. The solution of this problem requires new results from the study of a linear uniformly parabolic heat equation on a bounded domain with dynamic (or Wentzell) boundary conditions incorporating the Laplace-Beltrami operator. We prove that the semigroup governing this problem is analytic in the right half plane in  $L^p$  for all  $p > 1$  and for  $C$  in the supremum norm. The proof is long and delicate. This is joint work with Gisele Ruiz Goldstein and Michel Pierre.
